new urban mobility

THE SECOND
STAGE OF
DEVELOPMENT

A symposium on the latest achievements in urban mobility and the transformation of urban space with independent experts from four European cities

Urban mobility has changed: the car centered city has shifted to a city with more walking, cycling and public transport. Starting in the nineties, this development has now entered a second stage: after the first technical, matter-of-fact implementation of new infrastructure, early achievements are now being evaluated and reflected on, improved and refined.

Is new urban mobility a turnaround in city planning or just the latest trend in urban window dressing?
