

Architecture morphologies

Architecture morphologies:

Usage of biometric data to simulate human activities, flows and actions to recreate virtual scenarios, and integrate them into a process of design.

Understand the phenomena of occupy, space and activities in a different way

Using Particles:

The definition of space will be created by modifying the density of particles in certain areas and also by printing body postures on particles, using the body as a tool of design.

With particles we can recreate different physical phenomena using forces (gravity, turbulence, gravity), events (collisions, flows) and properties.

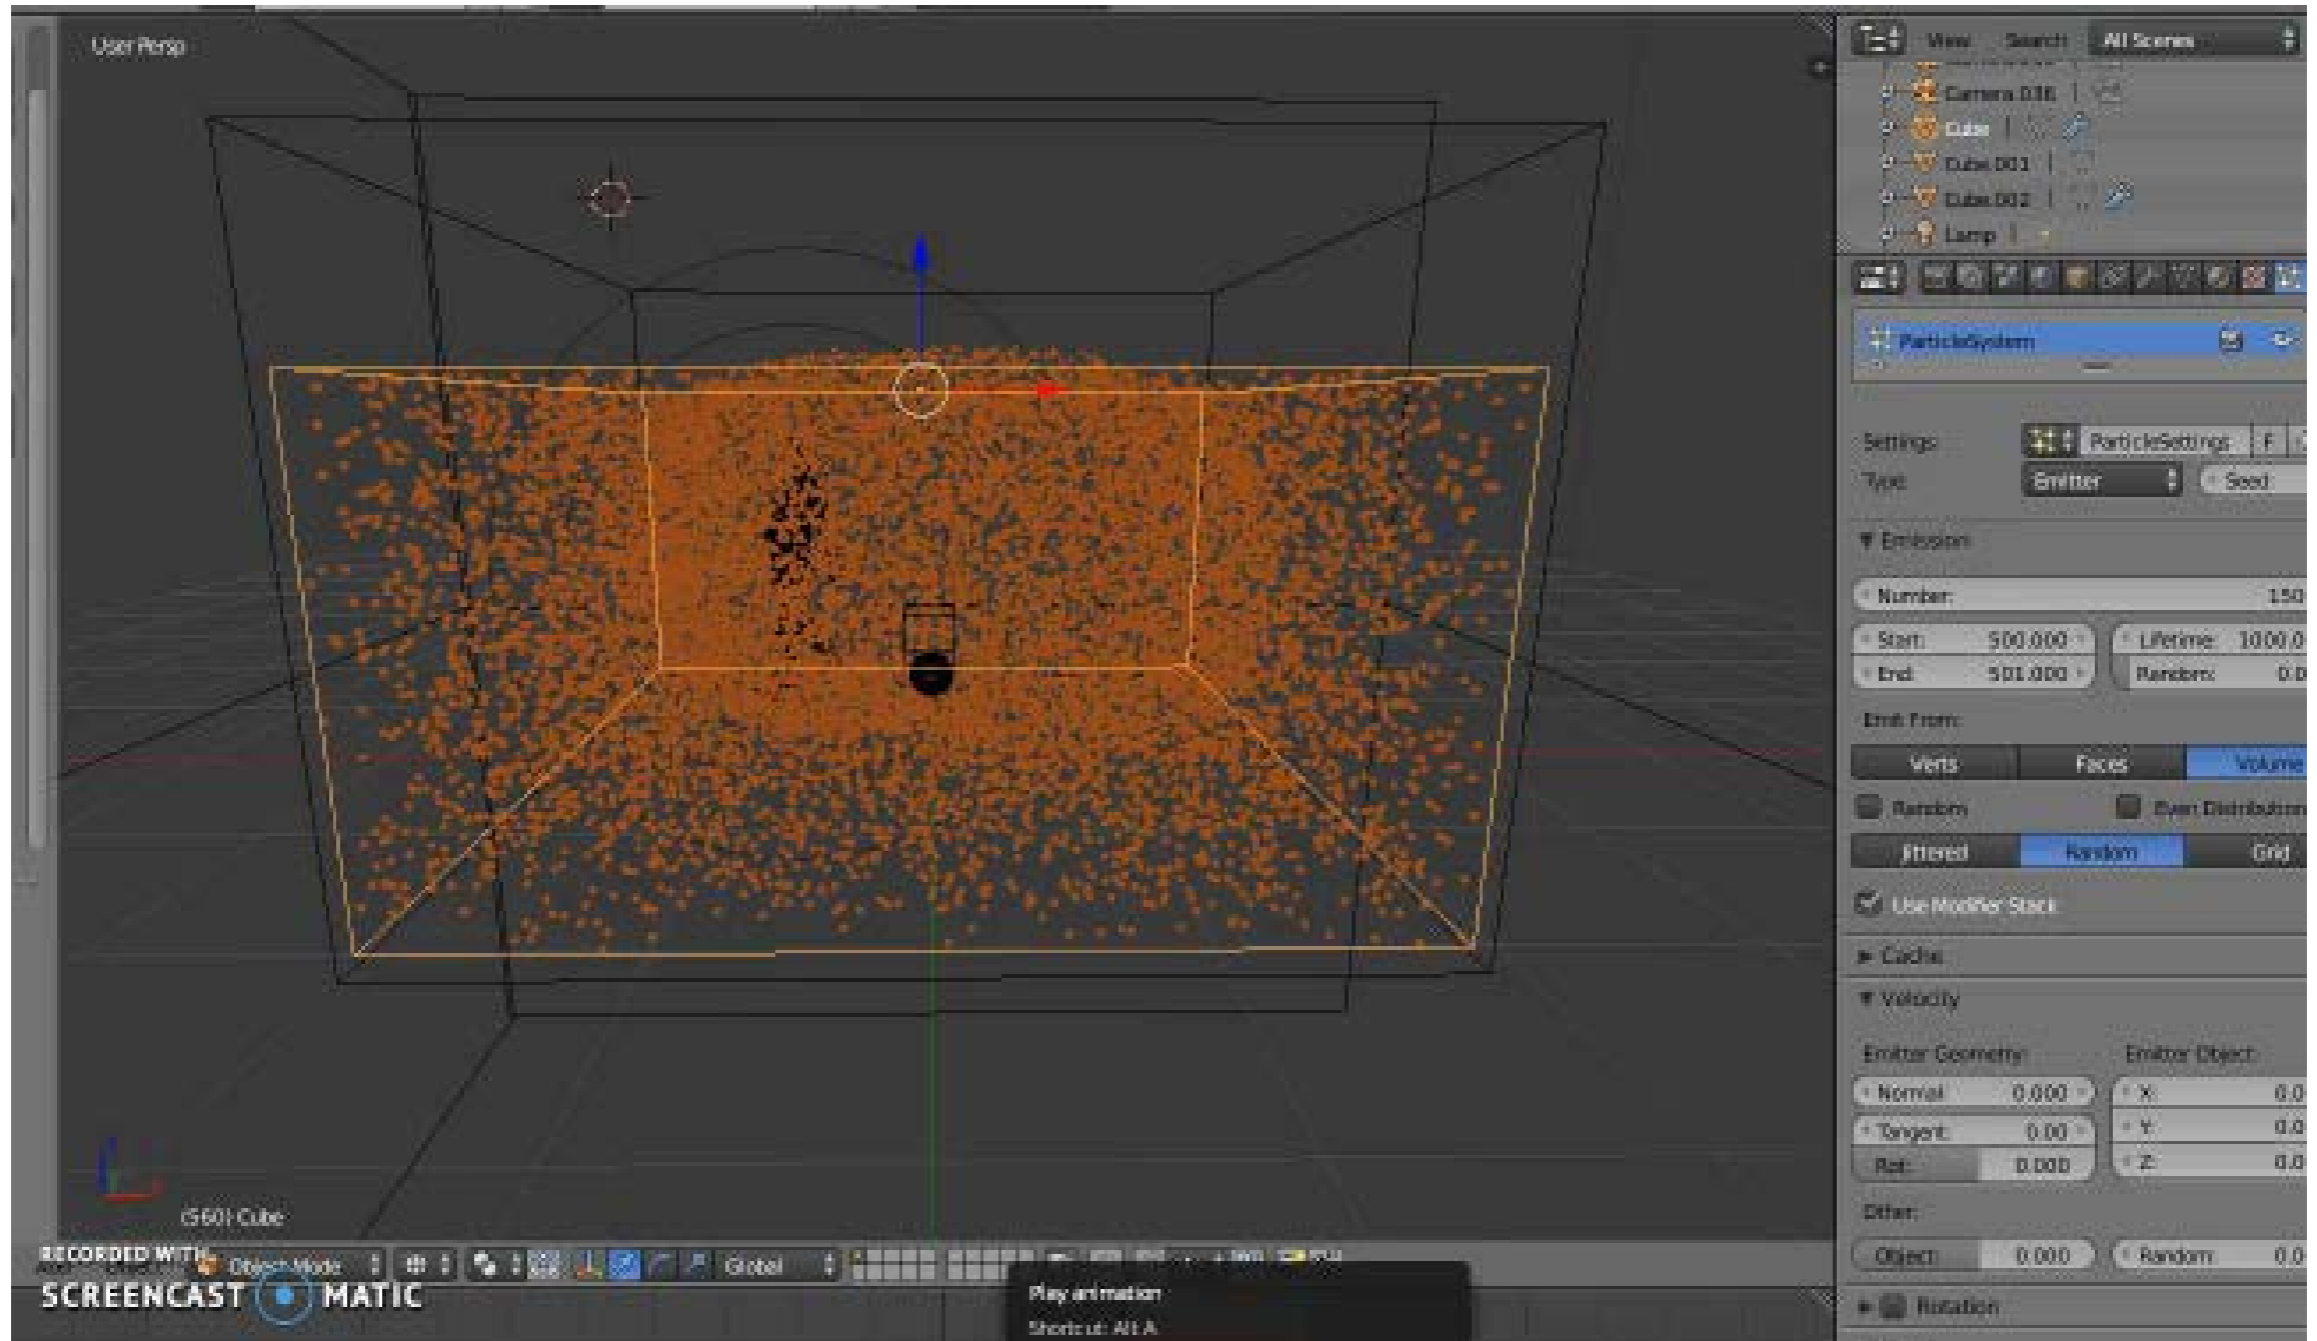

Walking

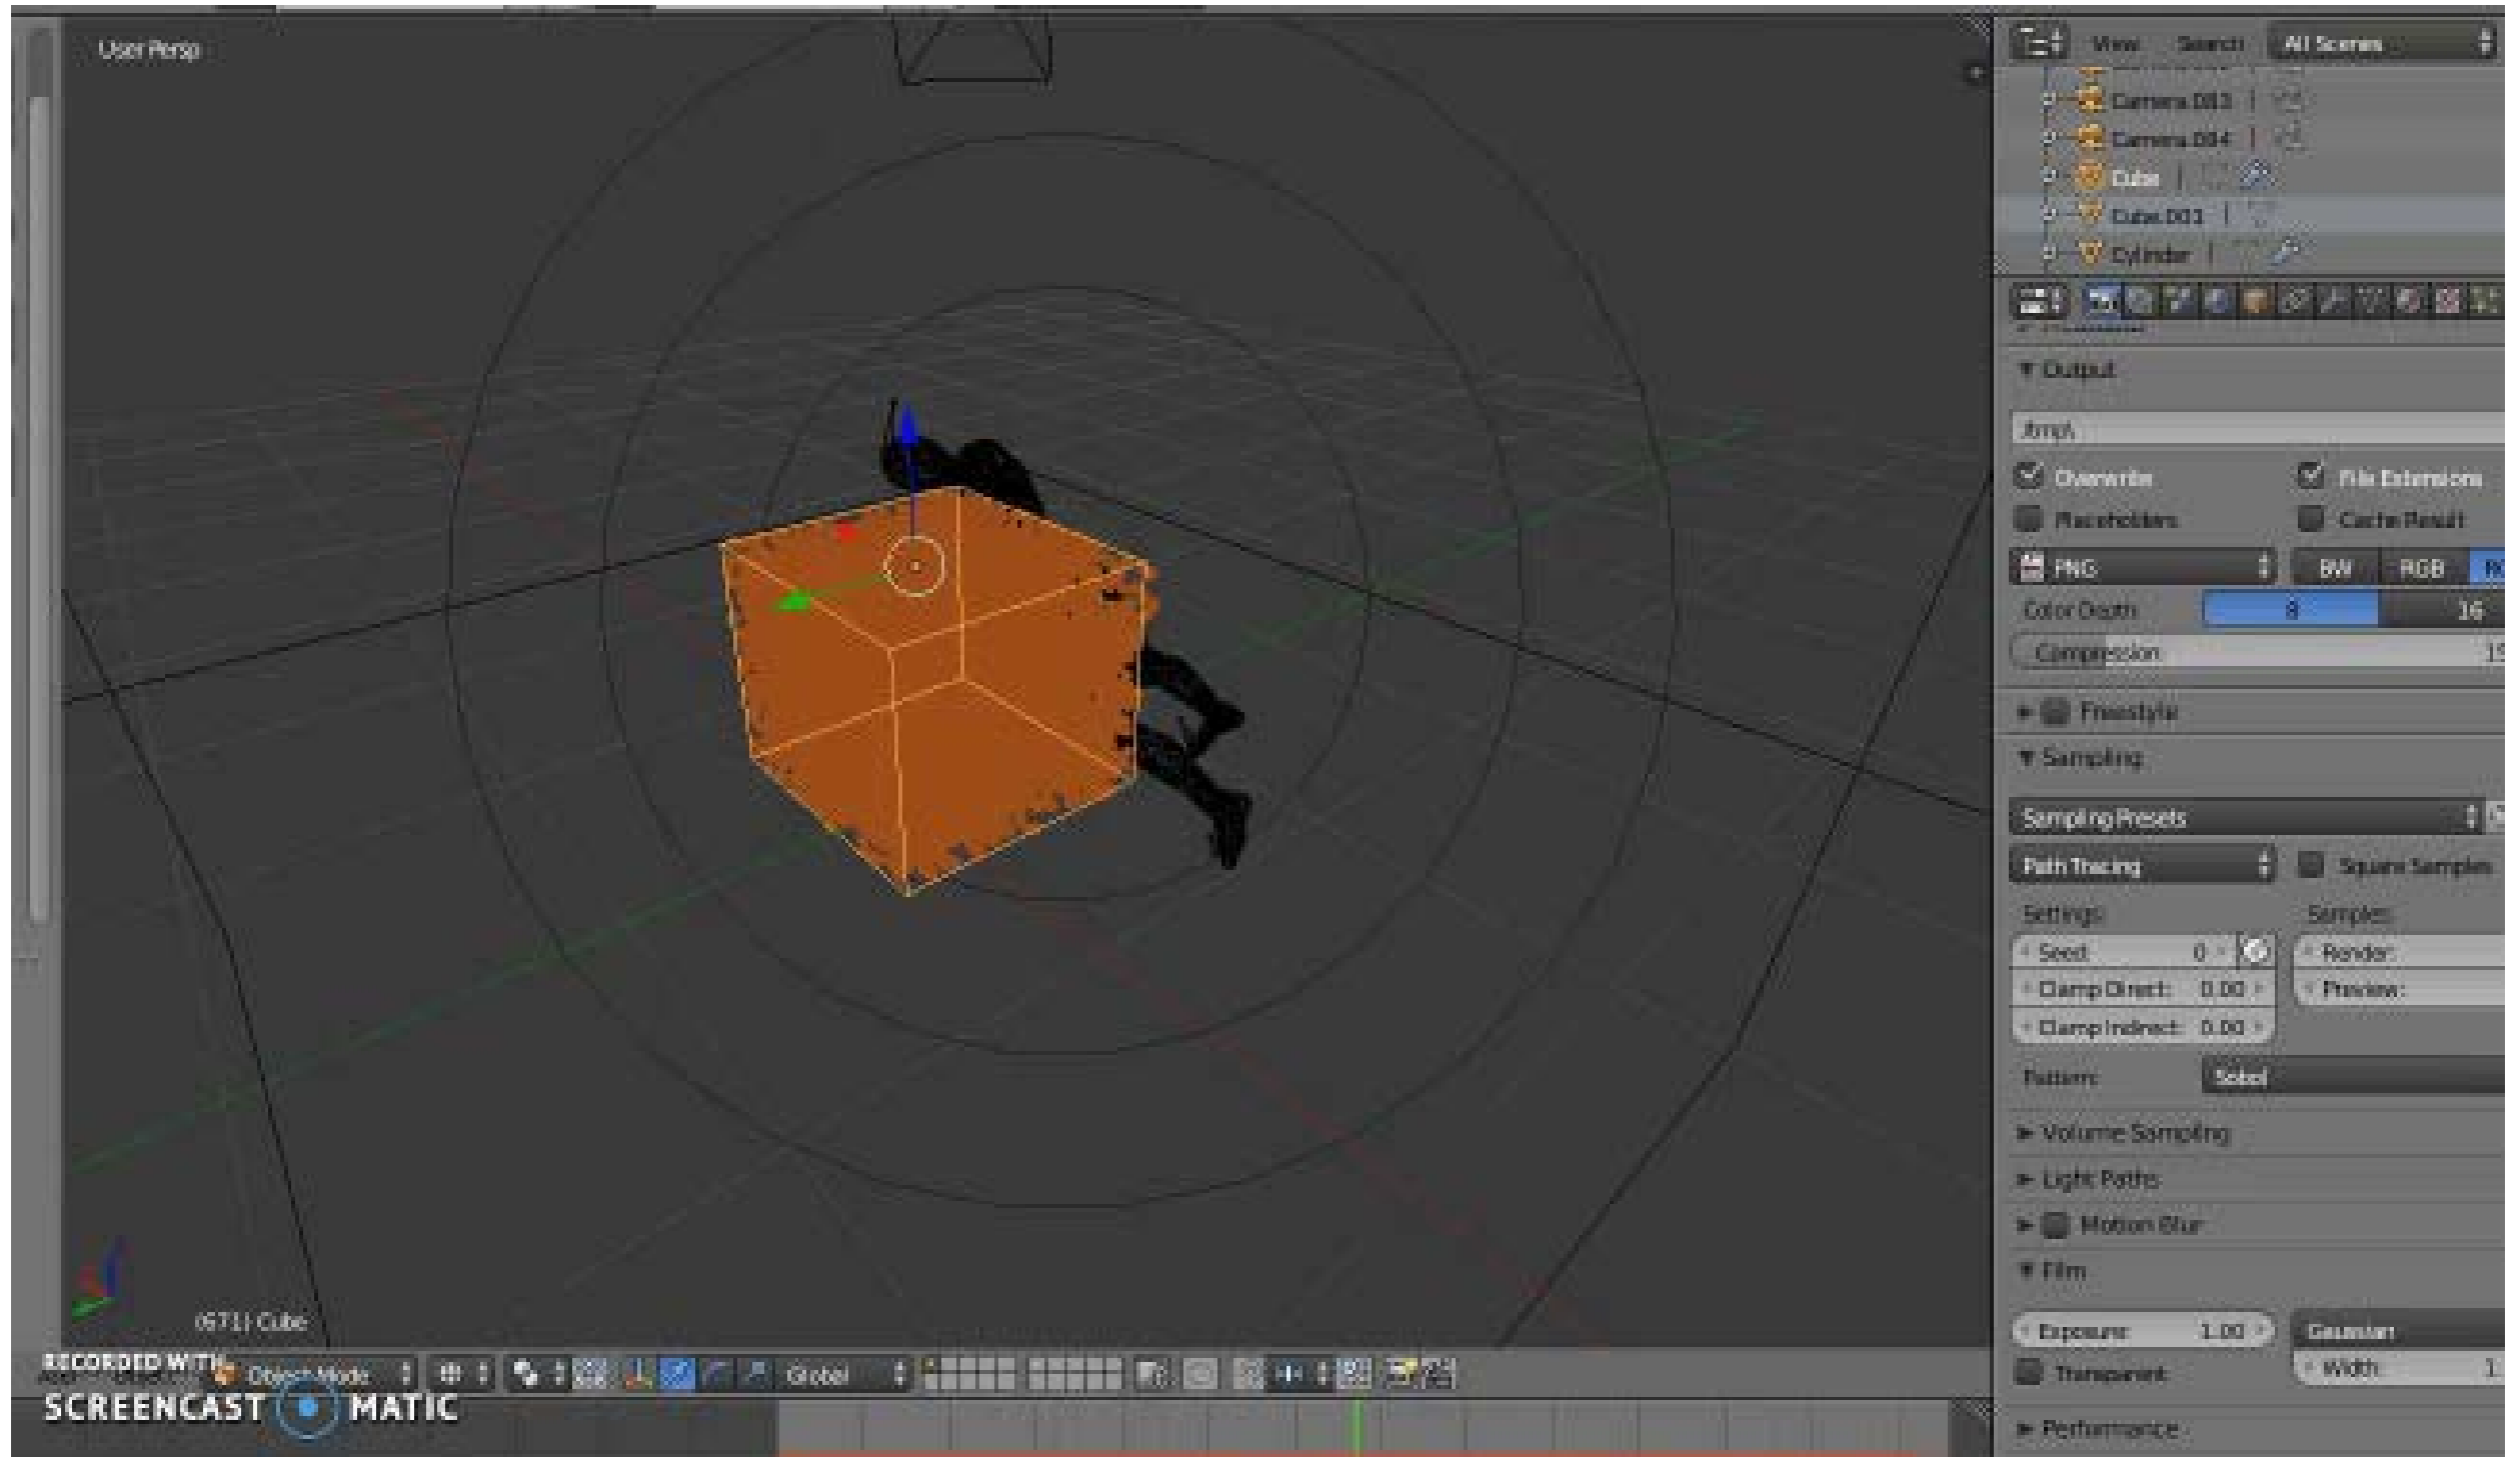

Defining space with movements

Posture prints

Movements and forces
